Product data sheet

The slurry pump guard plate is an important part of the slurry pump, like the sheath and the impeller, they are all part of the slurry pump flow-through. When the slurry pump is running, the guard plate is in direct contact with the slurry. The main function of the guard plate is to cooperate with the sheath to form a semi-closed flow channel, so that the slurry runs in this space, since the guard plate is parallel to the running direction of the slurry, the service life of the guard plate is longer than that of the sheath and the impeller.
